

IN THE ABSTRACT

~~This invention relates to the inhibition of S-adenosyl methionine decarboxylase for the prevention and/or the treatment of a herpes simplex virus infection.~~

Please delete the abstract as filed and substitute the one provided below.

The present invention relates to pharmaceutical compositions for the treatment of herpes simplex virus infections, including HSV-1 and HSV-2 infections, including an inhibitor of S-adenosyl methionine decarboxylase in combination with another agent for treating such infections, such as acyclovir, in an acceptable carrier.
